

The "one-size fits all" slogan does not always work in medicine. We are dedicated problem-solving pharmaceutical specialists who have been serving the health and medical needs. Simply, it is when a pharmacist creates one-of-a-kind medications based on the unique needs of a patient as ordered by a health care provider. A compounding pharmacist often prepares medications unavailable in a particular form or strength and must be compounded from the raw chemicals. Unlike manufactured medications where there are only a few different dosage strengths and forms, compounding allows for endless options. With compounding, dosages can be adjusted to meet the individual patient's needs, which is especially valuable in treating geriatric, pediatric or veterinary patients. Compounding can also eliminate unwanted ingredients such as dyes, sugar and preservatives

Compounding is the solution for those who need or want:

- Non-standard doses, adjusted according to the patient's lab data
- Out of production medicines
- Dental products and procedures for patient comfort
- Better tasting medicine
- Allergen-free materials
- Convenient combinations of multiple medications
- Pet health medications in non-standard forms, such as dog or cat treats.

Doctors in any field of medicine can prescribe medication for a patient in the form of:

- Creams
- Gels
- Ointments
- Rapid dissolve tablets
- Suppositories
- Nasal sprays
- Sublingual (under the tongue) sprays and drops
- Appealing flavors
